

TextEditor

Because both Zettlr and Atom are markdown editors, differences are marginal. Issues are links, searches, storage, and PDF conversion:

Autocomplete-bibtex seems not to work in Linux. A shame. but Zotero picker works almost just as well.

Zettlr is set on Linux; can do the footnotes and the PDF. Only a single editor, however. Atom, on the other hand, is having trouble with autocomplete-bibtex. Until that is fixed, the app must be Zettlr.

links: Z reads Obsidian backlinks directly. Atom has Wikilinks, but like Atom notes, must indicate the note and the directory.

searches Atom slightly more powerful

storage Atom more easily store in GitHub.

ease of writing Atom has dual editor; Zettlr needs kludges with Quick Look.

conversion Zettlr PDF requires YAML on mac (which changes title if different from designated file name);¹
